CMT Kerba Test Kit Usage Instructions

Step 1: Always disinfect the teat first

Step 2: Take a sample of milk from each quarter. Always face the paddle in the same direction, so that when you take the paddle out from under the cow, you know which quarter corresponds to which paddle

Step 3: Once you have 2/3 mls in each paddle, squirt in the reagent. One push of the dispensing bottle head is equal to 3ml

Step 4: Mix and then the high cell count milk will thicken and change colour. You will then know which quarter you have to treat or dry off
